There’s been a change in the Diabetic Ketoacidosis (DKA) guidelines!

(1) once blood glucose levels reach ≤14mmol/l (1).
Did you know?

UHB and (JBDS) Update:

(1) Once blood glucose levels reach ≤14mmol/l (1).

(2) Reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr

There’s been a change in the Diabetic Ketoacidosis (DKA) guidelines!
Did you know?

**UHB and (JBDS) Update:**

1. Once blood glucose levels reach ≤14mmol/l. 
2. Reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr.

There’s been a change in the Diabetic Ketoacidosis (DKA) guidelines!
UHB and (JBDS) Update:

(1) once blood glucose levels reach ≤14 mmol/l.
(2) reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr.
(3) This is alongside 10% glucose 125ml/hr administration.

There’s been a change in the Diabetic Ketoacidosis (DKA) guidelines!
Did you know?

UHB and (JBDS) Update:

(1) Once blood glucose levels reach $\leq 14$ mmol/l.

(2) Reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr.

(3) This is alongside 10% glucose 125 ml/hr administration.

There’s been a change in the Diabetic Ketoacidosis (DKA) guidelines!
Did you know? UHB and (JBDS) Update:

1. Once blood glucose levels reach ≤14mmol/l.
2. Reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr.
3. This is alongside 10% glucose 125ml/hr administration.

This would decrease the incidence of hypoglycaemia and hypokalaemia.

There's been a change in the Diabetic Ketoacidosis (DKA) guidelines!
Did you know?

UHB and (JBDS) Update:

1. Once blood glucose levels reach \( \leq 14 \text{ mmol/l} \).
2. Reduce the insulin infusion rate from 0.1 units/kg/hr to 0.05 units/kg/hr.
3. This is alongside 10% glucose 125ml/hr administration.

This would decrease the incidence of hypoglycaemia and hypokalaemia.
